

# GAUGEMASTER®

## MODEL DCC05 Prodigy WiFi Receiver

The DCC05 Prodigy WiFi receiver gives Android and iOS users the option to operate their Prodigy system with a smartphone or tablet. To install, simply connect the WiFi receiver into the controller or cab socket on your Prodigy base unit - you can do this with the lead provided or any Prodigy handset cable. The unit has LED lights to indicate power and communication and a small reset button. Using your device, connect to the MRCi-Fi in your device's WiFi settings and remember to download the compatible App. The Apps are for operating the layout and accessories but do not allow reading or programming so keep your handset safe. You can also use your handset and WiFi devices together, simply remember to set the Cab number higher than your last handset number.

Compatible with JMRI Engine Driver and WiThrottle Apps:

Information and support can be found in the App or via their web sites.

### RED LED

Solid ON	Normal. CabBus is polling this device.
Flashing	CabBus is not polling this device number. Change "Last Cab" or change module's Cab number.
OFF	No CabBus signal. Should never happen. Disconnect and reconnect module.

### GREEN LED

Mostly ON / winking OFF	No connected Wi-Fi devices. Normal, until a device connects.
Mostly OFF / winking ON	Normal, indicates number of Wi-Fi devices connected to this module.
OFF	No Wi-Fi signal. Should never happen. Disconnect and reconnect module.

**This unit is for use with the Prodigy DCC system only.**
